

**NEVER
HAVE TO
HIDE YOUR
TOES EVER
AGAIN**

What to expect...

The **Q-CLEAR laser** provides safe light energy to painlessly irradiate fungus and kill it without any damage to the surrounding nail or skin. At the time of the procedure no visible change is seen until the nail begins to grow out. In a few months, a more normal nail is expected to appear.

A visit for consultation and treatment will take about 30 minutes. No post-treatment pain has been reported and you can immediately wear shoes, nail polish and resume all normal activities. We will discuss post-treatment care to avoid fungal re-infection.

Frequently Asked Questions...

IS THE LASER TREATMENT PAINFUL?

There is no need for anesthesia or painkillers. Some patients may experience slight warmth or an occasional snapping sensation during the procedure. The laser light passes through the toenail without damaging the surrounding skin.

DOES THE LASER TREATMENT WORK?

Studies show that that FDA approved Q-Clear fungal laser treatments clear the nail of fungus as well or better than oral medications that require blood tests and have a variety of side effects. The benefit of laser care is that only one treatment is required for most patients.

WHAT IS NAIL FUNGUS?

A fungus is an organism that lives in warm moist areas. Fungus of the toenails is a common problem that can affect people of all ages, although it most commonly affects individuals who are older. Toenail fungus often begins as an infection called tinea pedis (athletes foot). Over time it grows underneath the nail and causes changes to its appearance, such as a yellow or brownish discoloration.

IS THIS COVERED BY MY INSURANCE?

This procedure is considered cosmetic and therefore health insurance does not provide coverage. You can ask your employer if you can use your Health Savings account
